

## Features

- True power-on system
- Right angled or straight line connector
- Output over CAN bus
- Various column mounting proposals

## Non-Contacting Multiturn Angle Sensor Type 6000

### Introduction

Bourns® Type 6000 Non-Contacting Multiturn Angle Sensor is based on two magneto-resistive (AMR) sensor chips. Each sensor chip converts an angle position of a permanent magnet into two analog signals (one sine and one cosine signal). A highly efficient algorithm enables estimating the absolute angular position of a drive shaft that is connected to the device.

### Specifications

#### Angular Position

Range ..... -780 ° to +780 °  
Resolution ..... 0.1 °  
Absolute Linearity ..... ±1.4 °

#### Angular Speed

Range ..... -1016 to +1016 °/s  
Resolution ..... \*4 °/s

#### Data and Control Interface

CAN 2.0A (Optional CAN 2.0B) ..... See CAN Protocol  
Baud Rate ..... 500 kbit/s  
Data Rate ..... 10 ms  
Measure Data Delay ..... < 10 ms  
Adjusting a Zero Position ..... via CAN bus  
Calibration Control ..... via CAN bus  
“On Board” Software Update ..... via CAN bus  
Automatic Self-Test ..... See CAN Protocol  
Power Supply Voltage ..... +8 V to +16 V  
Supply Current ..... 50 mA  
Ambient Temperature ..... -40 °C to +85 °C

### Electrical Connection

#### Mating Connector:

AMP 0-936119-1 (064 MQS 4P PLUG Assembly)

| Pin No. | Pin Assignment |
|---------|----------------|
| 1       | GND            |
| 2       | Supply         |
| 3       | CAN HIGH       |
| 4       | CAN LOW        |

\* The sensor measures positive and negative speed, but only the absolute value is output in the CAN message

### CAN Protocol

The device sends a CAN message with the measurement data every 10 msec. The layout of the transmitted message is shown below.

#### CAN Transmit Message

| CAN-ID Kind of Message | Byte            | Bits  | Signal Destination  | Unit     | Measure Range | Measure Range (Digit) | Offset | Resolution (Unit/Digit) | Comments                              |
|------------------------|-----------------|-------|---|----------|---------------|-----------------------|--------|-------------------------|---------------------------------------|
| 0 x 2B0 transmit       | 0-1 (0-LB 1-HB) | 00-15 | Absolute angle position   | Degree   | -780...+780   | 57735...7800          | 0      | 0,1                     | Fault/not calibrated/default: 0x7FFF  |
|                        | 2               | 16-23 | Angle speed   | Degree/s | 0...+1016     | 0...254               | 0      | 4                       | Fault default: 0xFF                   |
|                        | 3               | 24-27 | Internal status:<br>111 = Calibrated and OK<br>101 = Not calibrated<br>110 = Fault<br>100 = Fault and not calibrated<br>000 = Not trimmed |          | 0...3         | 0...3                 | 0      | 1                       |                                       |
|                        | 3               | 28-31 | Free  |          | 0             | 0                     |        |                         | Internal use only                     |
|                        | 4               | 32-35 | Message counter   |          | 0...15        | 0...15                |        | 1                       | Should be incremented by each message |
|                        | 4               | 36-39 | Check sum   |          | 0...15        | 0...15                |        | 1                       | Check sum: see below                  |

#### Absolute Angle Position:

- Signed (integer)
- Angle position [degree] =  $N \cdot 0.1$ , for  $0 < N \leq 32767$  ( $N$  - digital value of the message) =  $(N-65536) \cdot 0.1$ , for  $N > 32767$

#### Angle Speed:

- Unsigned (char)
- Rotation speed [degree/s] =  $S \cdot 4$ , for  $0 < S \leq 254$  ( $S$  - digital value of the message) =  $0xFF$ , for  $S > 254$

Specifications are subject to change without notice.

The device characteristics and parameters in this data sheet can and do vary in different applications and actual device performance may vary over time. Users should verify actual device performance in their specific applications.

## CAN Protocol (Continued)

Rule to build the check sum:

*Temp\_result* = lower byte

(Angle position) XOR higher byte

(Angle position) XOR (Angle speed)

XOR

(Internal status)

Check sum = higher nibble

(Temp\_result) XOR lower nibble

(Temp\_result) XOR (Message counter)

The device is also able to receive messages. They are shown below.

### CAN Receive Message

| CAN-ID<br>Kind of<br>Message | Byte | Bits | Signal Destination                            | Unit | Measure<br>Range | Measure<br>Range<br>(Digit) | Offset | Resolution<br>(Unit/Digit) | Comments |
|------------------------------|------|------|---|------|------------------|-----------------------------|--------|----------------------------|----------|
| 0x7C0<br>receive             | 0    | 0-3  | Command word                                  |      |                  |                             |        |                            |          |
|                              | 0    | 4-7  | SAS transmit identifier<br>(SAS ID) bits 0-3  |      |                  |                             |        |                            |          |
|                              | 1    | 8-14 | SAS transmit identifier<br>(SAS ID) bits 4-10 |      |                  |                             |        |                            |          |
|                              | 1    | 15   | Free  |      |                  |                             |        |                            |          |

## Automatic Self-Test

The device checks the angular speed value, which is limited to 1016 degrees per second. If this limit exceeded, the device sends an error message according to the CAN Transmit Message (page 1).

### Command Word (CW)

| CW bit3            | CW bit2 | CW bit1 | CW bit0 | Instruction                 |
|--------------------|---------|---------|---------|-----------------------------|
| 0                  | 0       | 1       | 1       | Set up the zero position    |
| 0                  | 1       | 0       | 1       | Clear the old zero position |
| Other combinations |         |         |         | Only for internal use       |

Note:

To set up a new zero position, first it is necessary to delete the old zero position.
